DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 9/09/05 has been entered.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 31 and 34-36 are rejected under 35 U.S.C. 102(b) as being anticipated by Huang et al (US 5,592,731).

As applied to claim 31, Huang et al teach a method of constructing a stator, comprising:

- forming a plurality of arcuate stator segments (Fig. 6, 20), each segment having a concave surface (Fig. 6, see below), a convex surface (Fig. 6, see below), opposite end surfaces (Fig. 6, see below), and a plurality of teeth (Fig. 6, see below) extending inwardly from said concave surface;
- providing each segment with an electrical winding (Fig. 6, 37) having different portions that are arranged adjacent said concave, convex and end surfaces, said winding being adapted to be selectively energized to form a three-dimensional magnetic field about said winding;
- assembling said segments to form an annular stator (Fig. 5, 50); and
- placing a rotor within said stator (Abstract), said stator having at least two magnetic poles (Col. 2, lines 12-15) that are arranged to interact with the magnetic field in said stator.

As applied to claim 34, Huang et al teach that the winding (Fig. 6, 37) is embedded within the associated stator segment.

As applied to claim 35, Huang et al teach that the winding (Fig. 6, 37) is mounted on the associated stator segment.

As applied to claim 36, Huang et al teach that the rotor has a permanent magnet (Col. 2, lines 12-14), and wherein said magnetic poles on said rotor are created by the poles on said magnet.

Response to Arguments

4. Applicant's arguments (filed on 6/14/05) with respect to claims 31 and 34-36 have been considered but are moot in view of the new grounds of rejection.

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
